

JD Edwards Release 25 drives innovation by automating, optimizing, and transforming business processes, reflecting ORACLE's continued investment in the digital transformation of its customers.

Below, we summarize the most noteworthy **technical developments**:

Digital
Trasnformation

What are the enhancements?

Digital Transformation

1. Switch instruction in the Logic Extension

In this preview of JDE release 25, a Switch instruction is added to the logic extension. This new Switch function simplifies the structure needed to compare whether the same value is equal to different options. In this way, instead of using multiple if-else conditions, a single Switch structure can be used, allowing multiple decisions to be constructed in a more orderly and readable way, especially in scenarios with many possible paths depending on the value of a variable.

The Switch statement is based on defining a set of statements called case, each associated with a specific value to be compared with the evaluated value. When the instruction is executed, the system checks each case in order until a match is found. When a match is found, the logic associated with that case is executed and, generally, the evaluation of the other cases is interrupted.

Additionally, a default clause can be defined, which acts as a default option. This clause is executed only if none of the defined cases matches the evaluated value, ensuring that there is always a defined behavior.

2. EnterpriseOne Pages: Widget Pane

As part of the evolution started with the incorporation of widgets in EnterpriseOne Pages, announced in April this year, a new enhancement has been introduced that extends the customization possibilities: the Widget Pane.

This new feature makes it easy to add a widget pane to composite pages using drag-and-drop actions. Once the pane is inserted, the user can select the widget to be displayed, which facilitates the creation of interfaces adapted to different business contexts.

With this enhancement, it is possible to design more dynamic and functional pages, whether single or multiple panels, that integrate critical business information in visual formats such as graphs, indicators, badges, and text blocks.

The addition of the widget panel reinforces EnterpriseOne's commitment to flexibility and usability, giving users more powerful tools to visualize and manage their information effectively.

3. Allow system values in the "orchestration" input defaults.

This enhancement extends Orchestrator's capabilities, allowing inputs and variables used in an "orchestration" to take as default values information coming directly from the system, such as the current date, the execution environment or the identifier of the user running it

For example, when designing an orchestration that requires an address book number, it is now possible to configure this data so that, by default, the number corresponding to the user executing the process is automatically assigned.

In addition, for inputs and variables that handle dates, dynamic logic can be applied to set values based on the current date adjusted forward or backward, either days, months or years, thus facilitating the automation of processes that depend on variable time ranges.

This functionality optimizes the customization and automation of orchestrations, making processes more agile and adapted to the context in which they are executed.

4. Improved workflow message formatting

With this enhancement, messages generated in workflows can incorporate more complete visual elements, such as text with different styles, tables and graphics. This allows information to be presented in a clearer and more attractive way, improving communication and facilitating interpretation during process monitoring and control.

Why Unikal Tech Partners

Unikal Tech Partners is one of the main references in Europe for the implementation, evolution, and support of Oracle JD Edwards, integrating the experience and specialization of Neteris as a strategic partner of the group.

With hundreds of projects carried out around the world, Unikal leads migrations, integrations, and cloud deployments of JD Edwards in companies of all sectors and sizes.

+20 Años de experiencia	+50 Consultores	+30 Certificaciones	+20 Especializaciones
+30 Rollouts internacionales	+500 Desarrollos a medida	+10 Soluciones complementarias	+400 Implementaciones

We have our own team of certified consultants and development experts in Oracle JD Edwards, as well as our own solutions that expand its capabilities and accelerate return on investment. Our high-level training in new product versions—including Release 23—allows us to address any technological challenge with full confidence.

In addition, as an official certified provider, we help organizations take full advantage of JD Edwards & Oracle Business Intelligence tools, ensuring an evolution aligned with business strategy.
